Restoration
Plan

Everglades Restoration, Florida

Delta Restoration, Louisiana

Protect Shoreline

Keep shoreline in place in critical areas.

Maintain Shoreline Integrity

Let shore roll back, but prevent interior marsh erosion.

Maintain Sabine River Inflow

Maintain Atchafalaya Mudstream

Continue shoreline accretion along Chenier Plain.

Improve Hydrology Drainage

Lower water levels in swamps. Allow more natural flow of water. Provide flood protection if necessary.

Reduce Sedimentation in Cote Blanche Bays and Vermilion Bay and Maintain as Brackish

Lower Water Levels

Modify flow patterns to tidal marshes to the south.

Move Fresh Water South into Tidal Marshes

Move Atchafalaya waters into tidal marshes. In Chenier Plain, use water from lakes to freshen southern brackish marshes.

Beneficial Use of Dredged Material or Dedicated Dredging

Create marsh in various sites along the coast.

Maximize Land Building in Atchafalaya Delta

Separate navigation from delta. Train lobe toward Four League Bay.

Maintain Land Bridges

Preserve the three land bridges to prevent marine forces from moving inland and large lakes from joining.

Small Diversions from Mississippi River (<5,000 cfs)

Allow river water and nutrients to nourish swamps and marshes. Flood protection where needed. Provide outfall management.

Optimize Atchafalaya Flow to West and East

Use Atchafalaya sediments and nutrients to preserve marshes.

Conveyance Channel from Mississippi River to Build Deltas

Build marsh and nourish adjacent wetlands in area of highest land loss.

Solve the Mississippi River Gulf Outlet Problem

Close MRGO when deep-draft container facilities are available on river. In interim, stabilize north bank, purchase oyster leases, create marsh in southern lobe of Lake Borgne.

Delta-building Diversions from Mississippi River (15,000-100,000 cfs)

Build marsh and nourish adjacent marsh. Address oyster issues.

Multi-purpose Control of Navigation Channels

Prevent saline waters from continuing to damage marshes to north. Retain fresh water.

Restore/maintain Barrier Islands, Headlands, Shorelands

Use most cost-effective means to protect these first lines of defense from storms.

Prevent Loss of Sediments into the Deep Gulf

Separate navigation from riverine processes. Build sediment trap and pump out to create marsh.

History of Ecological Engineering

- H.T. Odum (1960s) mention of ecological engineering in several publications
- Ma Shijun (1960s-70s in China; 1985 in Western literature) “father of ecological engineering in China”
- Ecotechnology of Uhlmann, Straskraba and Gnauek (1983-1985)
- Mitsch and Jørgensen ecological engineering book (1989)
- First ecological engineering meeting in Trosa Sweden (1991) followed by Etnier and Guterstam book (1991, 1997)

History of Ecological Engineering

- *Ecological Engineering* journal started (1992)
- Ecological engineering workshop in Washington DC at National Academy of Sciences (1993)
- IEES started in Utrecht, The Netherlands (1993)
- SCOPE project in ecological engineering and ecosystem restoration established in Paris (1994 - 2002)
- Discussions of American ecological engineering society in Columbus (1999); AEES first meeting, Athens, GA (2001)
- Mitsch and Jørgensen (2004) and Kangas (2004) ecological engineering textbooks completed

SCOPE International Workshops on Ecological Engineering and Ecosystem Restoration

Workshop Title	Location/ Date	Publication in Ecol Eng
Remediation of ecosystems damaged by environmental contamination	Tallinn, Estonia November 1995	Mitsch and Mander, 1997
Ecological engineering in developing countries	Beijing, China October 1996	Wang et al., 1998
Ecological engineering applied to river and wetland restoration	Paris, France July 1998	Lefeuvre et al., 2002
Ecology of post-mining landscapes	Cottbus, Germany March 1999	Hüttl and Bradshaw, 2001

Ecological Engineering

**the design of sustainable
ecosystems that integrate human
society with its natural
environment for the benefit of both**

Goals of Ecological Engineering

1. the restoration of ecosystems that have been substantially disturbed by human activities such as environmental pollution or land disturbance; and
2. the development of new sustainable ecosystems that have both human and ecological value.

Ecological Restoration

**the return of an ecosystem to a
close approximation of its
condition prior to disturbance**

Terms that are synonyms, subdisciplines, or fields similar to ecological engineering

- synthetic ecology
 - restoration ecology
 - bioengineering
 - sustainable agroecology
 - habitat reconstruction
 - ecohydrology
 - ecosystem rehabilitation
 - biospherics
 - biomanipulation
 - river and lake restoration
 - wetland restoration
 - reclamation ecology
 - nature engineering
 - ecotechnology
 - engineering ecology
 - solar aquatics
-

Contrasts with Other Fields

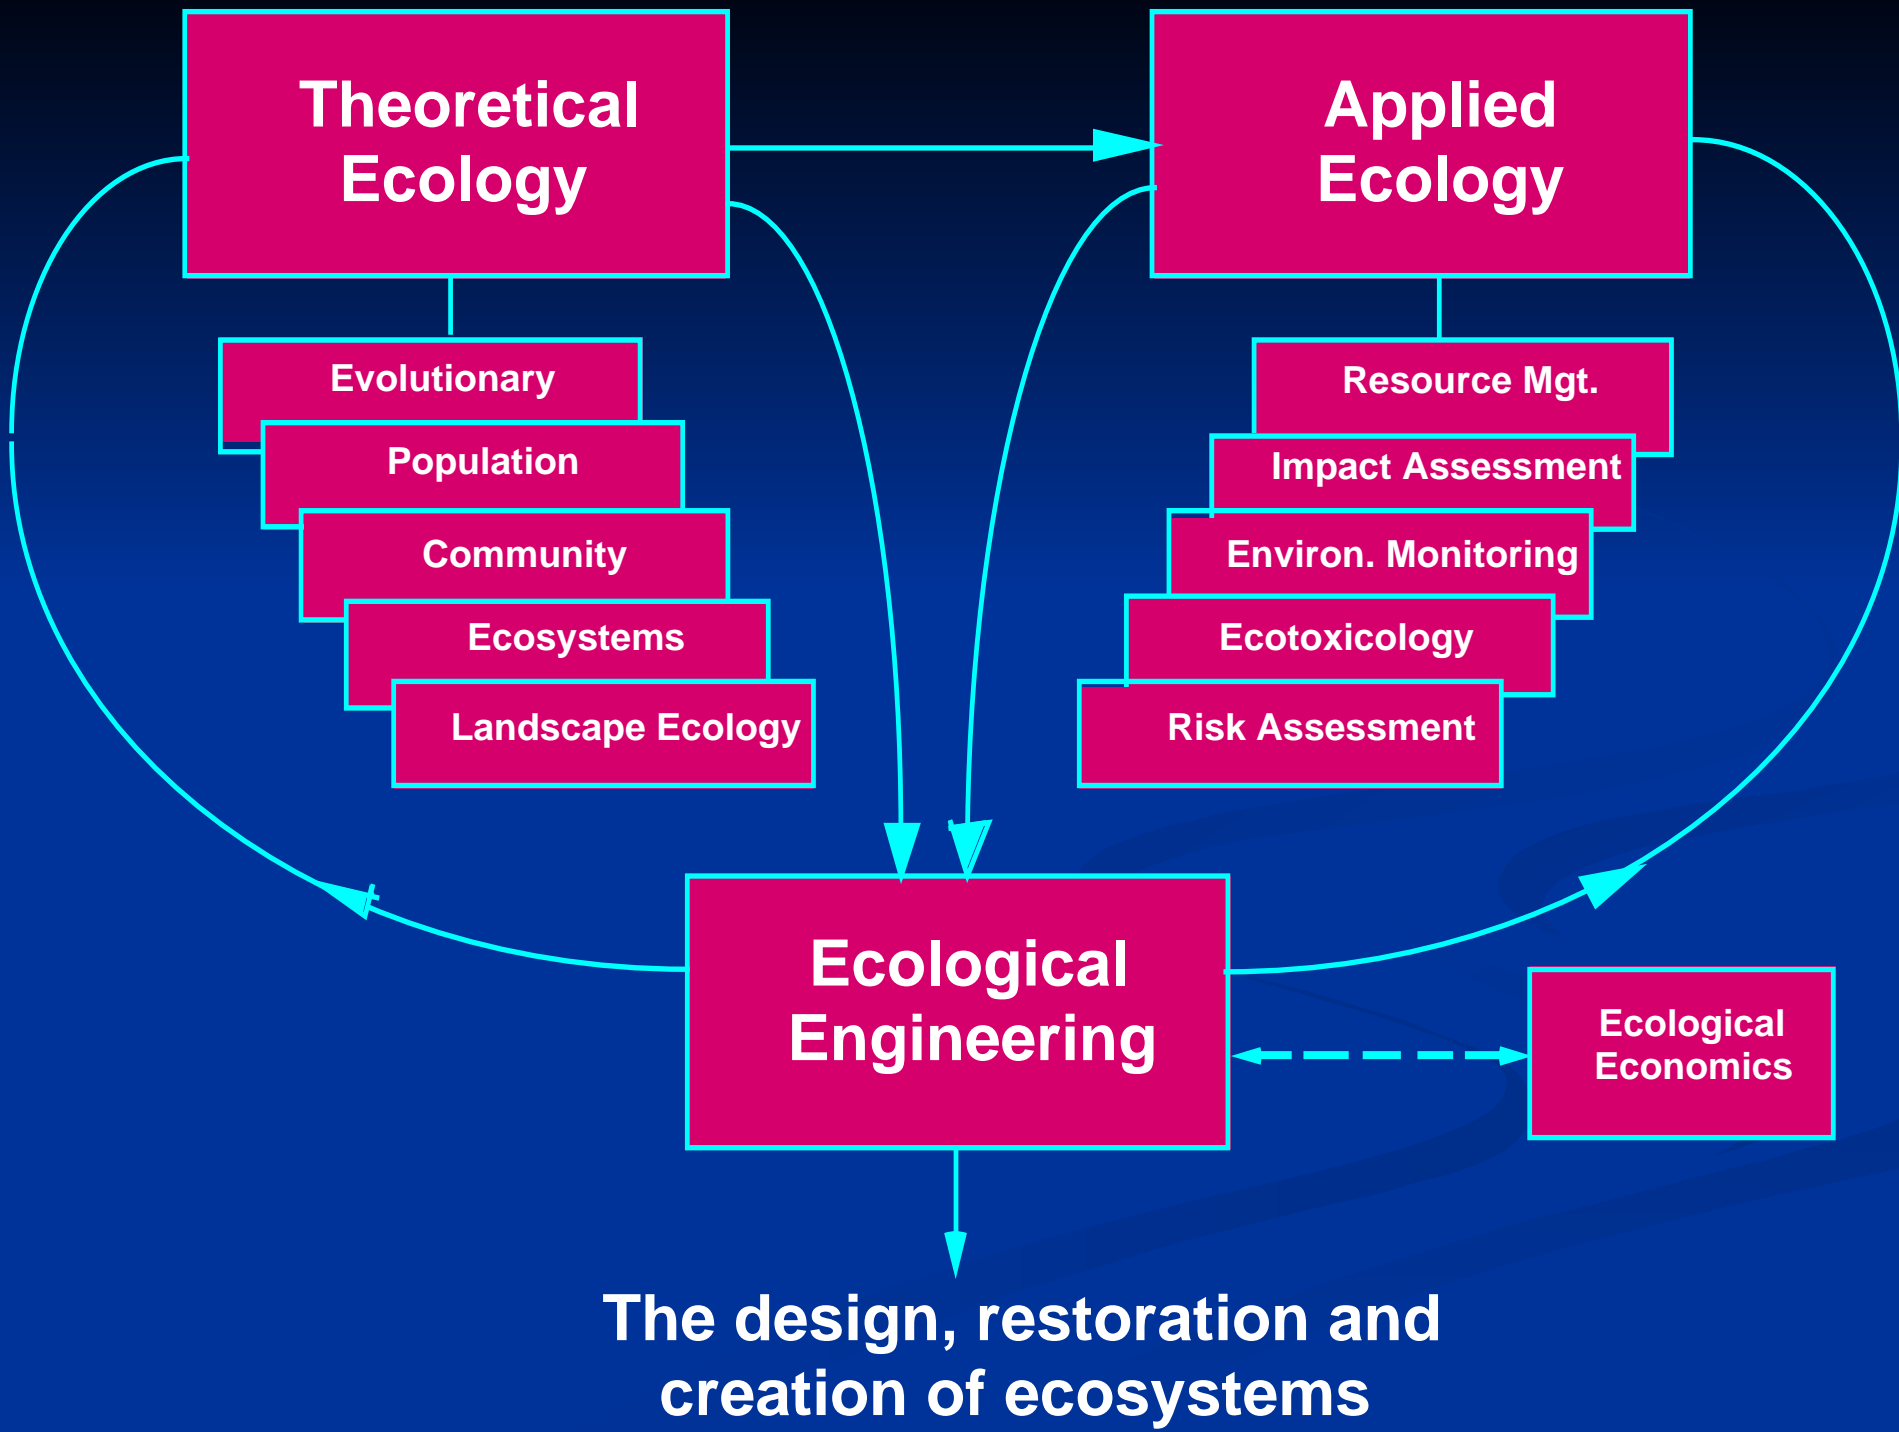

- Environmental engineering
- Biotechnology

Comparison of ecotechnology and biotechnology

Characteristic	Ecotechnology	Biotechnology
Basic unit	Ecosystem	Cell
Basic principles	Ecology	Genetics; cell biology
Control	Forcing functions, organisms	Genetic structure
Design	Self-design with some human help	Human design
Biotic diversity	Protected	Changed
Maintenance and development costs	Reasonable	Enormous
Energy basis	Solar based	Fossil fuel based

Contrasts with Other Fields

- Environmental engineering
- Biotechnology
- Ecology

Contrasts with Other Fields

- Ecotechniques/Cleaner Technology
 - Industrial Ecology

Ecological Engineering Principles

Self-design

The application of self-
organization in the design of
ecosystems

Systems categorized by types of organization (modified from Pahl-Wostl, 1995)

Characteristic	Imposed organization	Self-organization
Control	externally imposed; centralized control	endogenously imposed; distributed control
Rigidity	rigid networks	flexible networks
Potential for adaptation	little potential	high potential
Application	conventional engineering	ecological engineering
Examples	machine fascist or socialist society agriculture	organism democratic society natural ecosystem

whole-ecosystem experiment in self-design

A Systems Approach

Nonrenewable Resource Conservation

Conventional Engineering

Ecological Engineering

Ecosystem Conservation

“To keep every cog and wheel is the first precaution of intelligent tinkering.”

Aldo Leopold

Ecological Design Principles

1. Ecosystem structure and function are determined by the forcing functions of the system.
2. Energy inputs to the ecosystem and available storage of matter are limited.
3. Ecosystems are open and dissipative systems.
4. Attention to a limited number of factors is most strategic in preventing pollution or restoring ecosystems.
5. Ecosystems have some homeostatic capability that results in smoothing out and depressing the effects of strongly variable inputs.
6. Match recycling pathways to the rates to ecosystems to reduce the effect of pollution.

Ecological Design Principles

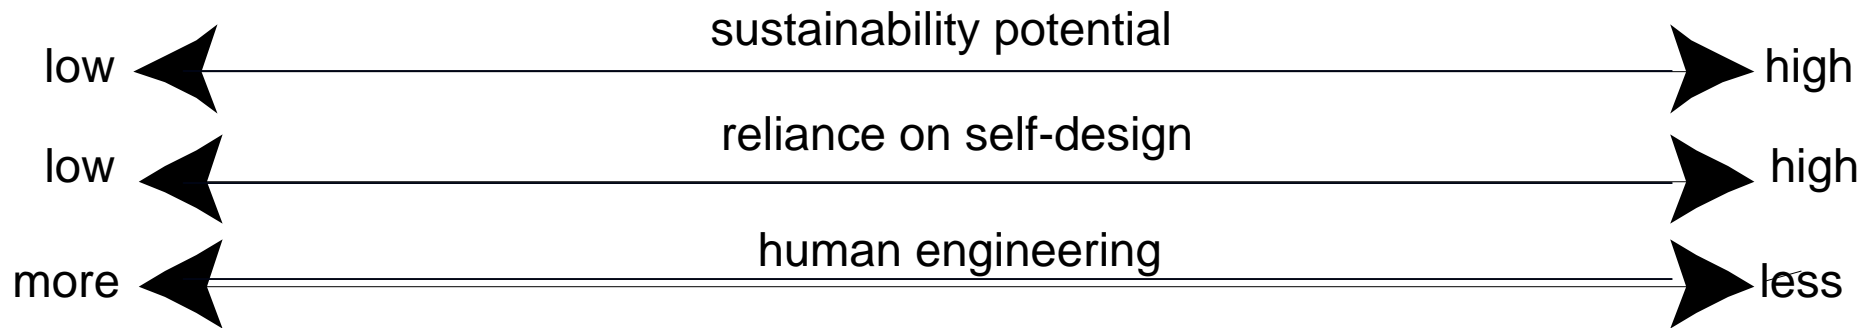

7. Design for pulsing systems whenever possible.
8. Ecosystems are self-designing systems.
9. Processes of ecosystems have characteristic time and space scales that should be accounted for in environmental management.
10. Biodiversity should be championed to maintain an ecosystem self-design capacity.
11. Ecotones, transition zones, are as important for ecosystems as membranes are for cells.
12. Coupling between ecosystems should be utilized wherever possible.

Ecological Design Principles

13. The components of an ecosystem are interconnected, interrelated, and form a network, implying that direct as well as indirect effects of ecosystem development need to be considered.
14. An ecosystem has a history of development.
15. Ecosystems and species are most vulnerable at their geographical edges.
16. Ecosystems are hierarchical systems and are parts of a larger landscape.
17. Physical and biological processes are interactive. It is important to know both physical and biological interactions and to interpret them properly.
18. Ecotechnology requires a holistic approach that integrates all interacting parts and processes as far as possible.
19. Information in ecosystems is stored in structures.

Classification of Ecological Engineering

Classification According to Sustainability

Biosphere 2

Biomanipulation

Prairie Restoration

Soil Bioremediation

Wetland Creation

Wetland Restoration

Solar Aquatics

Wastewater Wetlands

Mineland Restoration

Agroecological Engineering

Classification According to Function

Functional classification

- Ecosystems are used to reduce or solve a pollution problem
- Ecosystems are imitated or copied to reduce a resource problem
- The recover of ecosystems is supported
- Existing ecosystems are modified in an ecologically sound way
- Ecosystems are used for the benefit of humankind without destroying the ecological balance

Examples of ecological engineering approaches for terrestrial and aquatic systems according to types of applications.

Ecological Engineering Approaches	Terrestrial Examples	Aquatic Examples
1. Ecosystems are used to solve a pollution problem	Phytoremediation	Wastewater wetland
2. Ecosystems are imitated or copied to reduce or solve a problem	Forest restoration	Replacement wetland
3. The recovery of an ecosystem is supported after disturbance	Mine land restoration	Lake restoration
4. Existing ecosystems are modified in an ecologically sound way	Selective timber harvest	Biomanipulation
5. Ecosystems are used for benefit without destroying ecological balance	Sustainable agroecosystems	Multi-species aquaculture

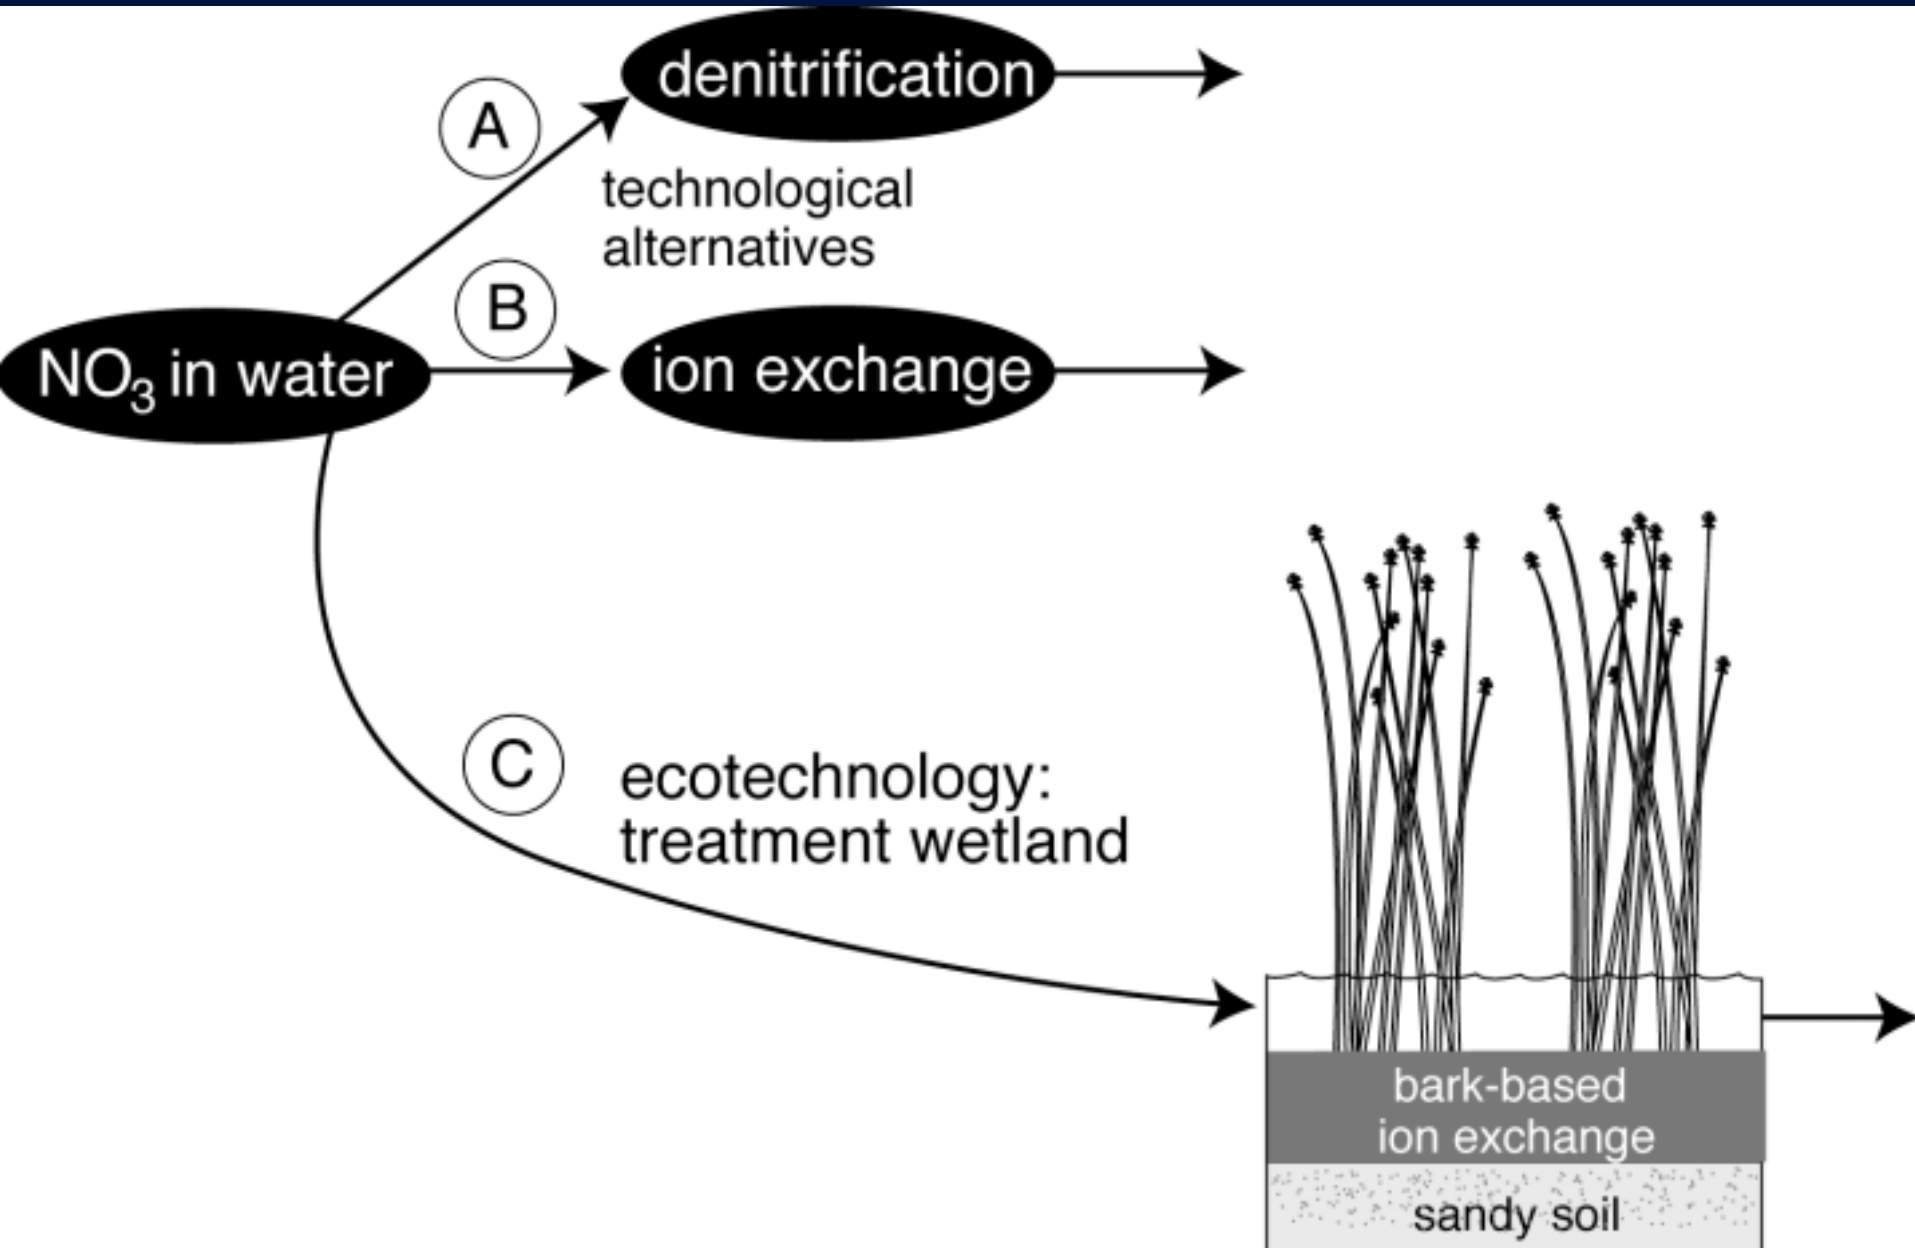

Solving or reducing a pollution problem

Solving or reducing a pollution problem

sound way—
Biomanipulation

Source: Hosper
and Meijer, 1992

Classification According to Scale

- Mesocosm scale
- Ecosystem scale
- Regional scale

When to Use Ecotechnology

1. The parts of nature affected, directly and indirectly, must be determined.
2. Quantitative assessment of impact of all alternatives must be carried out.
3. Project needs to include entire system, including human impacts and affected ecosystem.
4. Optimization should include short and long-term effects.
5. Renewable and nonrenewable resource use should be quantified.
6. Uncertainty should be accounted for in ecological and economic components.
